

Only 93% of kindergarteners in South Dakota received all vaccines recommended for the 22-23 school year. For decades, high immunization rates have protected our kids from the consequences of vaccine preventable diseases. But our vaccination rates are declining.

**Percentage of kindergarteners up to date on MMR vaccination for school years 22-23 and 21-22**

Key ■ = Protected from measles  
■ = At risk for outbreak

Only 27 counties meet the threshold of 94% immunity required to prevent an outbreak of **whooping cough, which hospitalizes 50% of babies and kills 1 in 100.** The Tdap vaccine protects against whooping cough.

51 counties meet the threshold of 86% immunity needed to prevent outbreaks of **polio, mumps, rubella, and diphtheria, which are dangerous diseases.** The polio, MMR, and Tdap vaccines protect against these diseases.

Only 25 counties meet the threshold of 95% immunity needed to prevent an outbreak of **measles, which hospitalizes 1 in 5 unvaccinated individuals and can kill.** The MMR vaccine protects against measles.
